**Decision Tree Learning** 

# Learning Decision Trees. Supervised Classification.

#### Useful Readings:

- Mitchell, Chapter 3
- Bishop, Chapter 14.4

DT learning: Method for learning discrete-valued target functions in which the function to be learned is represented by a decision tree.

#### **Supervised Classification: Decision Tree Learning**

**Example**: learn concept **PlayTennis** (i.e., decide whether our friend will play tennis or not in a given day)

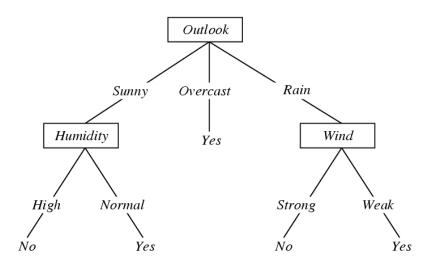

Simple	ay	Outlook	Temperature	Humidity	Wind	Play Ten	nis
Training							
Training	D1	$\operatorname{Sunny}$	$\operatorname{Hot}$	$\operatorname{High}$	$\operatorname{Weak}$	No	
Data Set	D2	Sunny	$\operatorname{Hot}$	$\operatorname{High}$	Strong	No	
	D3	Overcast	Hot	$\operatorname{High}$	Weak	Yes	
example	D4	Rain	Mild	$\operatorname{High}$	Weak	Yes	label
·	D5	Rain	Cool	Normal	Weak	Yes	
	D6	Rain	Cool	Normal	Strong	No	
	D7	Overcast	Cool	Normal	Strong	Yes	
	D8	Sunny	Mild	$\operatorname{High}$	Weak	No	
	D9	Sunny	Cool	Normal	Weak	Yes	
	D10	Rain	Mild	Normal	Weak	Yes	
	D11	Sunny	Mild	Normal	Strong	Yes	
	D12	Overcast	Mild	$\operatorname{High}$	Strong	Yes	
	D13	Overcast	$\operatorname{Hot}$	Normal	Weak	Yes	
	D14	Rain	Mild	$\operatorname{High}$	Strong	No	

#### **Supervised Classification: Decision Tree Learning**

- Each internal node: test one (discrete-valued) attribute X<sub>i</sub>
- Each branch from a node: corresponds to one possible values for X<sub>i</sub>
- Each leaf node: predict Y (or  $P(Y=1|x \in leaf)$ )

Example: A Decision tree for

f: <Outlook, Temperature, Humidity, Wind> → PlayTennis?

Day	Outlook	Temperature	Humidity	Wind	Play Tennis
D1	Sunny	Hot	High	Weak	No
D2	Sunny	$\operatorname{Hot}$	High	Strong	No
D3	Overcast	$\operatorname{Hot}$	$_{ m High}$	Weak	Yes
D4	Rain	$\operatorname{Mild}$	High	Weak	Yes
D5	Rain	Cool	Normal	Weak	Yes
D6	Rain	Cool	Normal	Strong	No
D7	Overcast	Cool	Normal	Strong	Yes
D8	Sunny	Mild	$_{ m High}$	Weak	No
D9	Sunny	Cool	Normal	Weak	Yes
D10	Rain	$\operatorname{Mild}$	Normal	Weak	Yes
D11	Sunny	$\operatorname{Mild}$	Normal	Strong	Yes
D12	Overcast	Mild	$_{ m High}$	Strong	Yes
D13	Overcast	$\operatorname{Hot}$	Normal	Weak	Yes
D14	Rain	Mild	$_{ m High}$	Strong	No

E.g., x=(Outlook=Sunny, Temperature=Hot, Humidity=Normal, Wind=Weak) f(x)=Yes.

E.g., x=(Outlook=Rain, Temperature=Hot, Humidity=Normal, Wind=Strong) f(x)=No

# **Supervised Classification: Problem Setting**

**Input:** Training labeled examples  $\{(x^{(i)}, y^{(i)})\}$  of unknown target function f

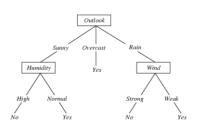

• Examples described by their values on some set of features or attributes

Day	Outlook	Temperature	Humidity	Wind	Play Tennis
D1	Sunny	Hot	High	Weak	No
D2	Sunny	Hot	High	Strong	No
D3	Overcast	Hot	High	Weak	Yes
D4	Rain	Mild	High	Weak	Yes
D5	Rain	Cool	Normal	Weak	Yes
D6	Rain	Cool	Normal	Strong	No
D7	Overcast	Cool	Normal	Strong	Yes
D8	Sunny	$_{ m Mild}$	High	Weak	No
D9	Sunny	Cool	Normal	Weak	Yes
D10	Rain	Mild	Normal	Weak	Yes
D11	Sunny	Mild	Normal	Strong	Yes
D12	Overcast	Mild	High	Strong	Yes
D13	Overcast	$\mathbf{Hot}$	Normal	Weak	Yes
D14	Rain	Mild	High	Strong	No

- E.g. 4 attributes: *Humidity, Wind, Outlook, Temp* 
  - e.g., <*Humidity=High, Wind=weak, Outlook=rain, Temp=Mild>*
- Set of possible instances *X* (a.k.a instance space)
- Unknown target function  $f: X \rightarrow Y$ 
  - e.g.,  $Y = \{0,1\}$  label space
  - e.g., 1 if we play tennis on this day, else 0

**Output:** Hypothesis  $h \in H$  that (best) approximates target function f

- Set of function hypotheses  $H=\{h \mid h: X \rightarrow Y\}$ 
  - each hypothesis h is a decision tree

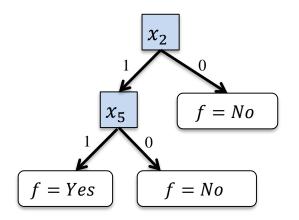

#### **Supervised Classification: Decision Trees**

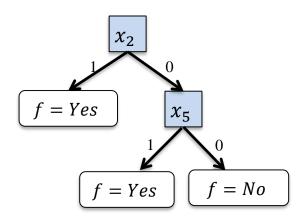

Suppose  $X = \langle x_1, ... x_n \rangle$ where  $x_i$  are boolean-valued variables

How would you represent the following as DTs?

$$f(x) = x_2 \ AND \ x_5 ?$$

$$f(x) = x_2 OR x_5$$

Hwk: How would you represent  $X_2 X_5 \vee X_3 X_4 (\neg X_1)$ ?

# **Supervised Classification: Problem Setting**

**Input:** Training labeled examples  $\{(x^{(i)}, y^{(i)})\}$  of unknown target function f

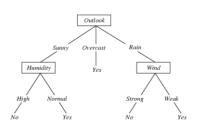

• Examples described by their values on some set of features or attributes

Day	Outlook	Temperature	Humidity	Wind	Play Tennis
D1	Sunny	Hot	High	Weak	No
D2	Sunny	Hot	High	Strong	No
D3	Overcast	Hot	High	Weak	Yes
D4	Rain	Mild	High	Weak	Yes
D5	Rain	Cool	Normal	Weak	Yes
D6	Rain	Cool	Normal	Strong	No
D7	Overcast	Cool	Normal	Strong	Yes
D8	Sunny	$_{ m Mild}$	High	Weak	No
D9	Sunny	Cool	Normal	Weak	Yes
D10	Rain	Mild	Normal	Weak	Yes
D11	Sunny	Mild	Normal	Strong	Yes
D12	Overcast	Mild	High	Strong	Yes
D13	Overcast	$\mathbf{Hot}$	Normal	Weak	Yes
D14	Rain	Mild	High	Strong	No

- E.g. 4 attributes: *Humidity, Wind, Outlook, Temp* 
  - e.g., <*Humidity=High, Wind=weak, Outlook=rain, Temp=Mild>*
- Set of possible instances *X* (a.k.a instance space)
- Unknown target function  $f: X \rightarrow Y$ 
  - e.g.,  $Y = \{0,1\}$  label space
  - e.g., 1 if we play tennis on this day, else 0

**Output:** Hypothesis  $h \in H$  that (best) approximates target function f

- Set of function hypotheses  $H=\{h \mid h: X \rightarrow Y\}$ 
  - each hypothesis h is a decision tree

## **Core Aspects in Decision Tree & Supervised Learning**

How to automatically find a good hypothesis for training data?

• This is an algorithmic question, the main topic of computer science

When do we generalize and do well on unseen data?

- Learning theory quantifies ability to *generalize* as a function of the amount of training data and the hypothesis space
- Occam's razor: use the *simplest* hypothesis consistent with data!

Fewer short hypotheses than long ones

- a short hypothesis that fits the data is less likely to be a statistical coincidence
- highly probable that a sufficiently complex hypothesis will fit the data

## Core Aspects in Decision Tree & Supervised Learning

How to automatically find a good hypothesis for training data?

• This is an algorithmic question, the main topic of computer science

When do we generalize and do well on unseen data?

- Occam's razor: use the *simplest* hypothesis consistent with data!
- Decision trees: if we were able to find a small decision tree that explains data well, then good generalization guarantees.
  - NP-hard [Hyafil-Rivest'76]: unlikely to have a poly time algorithm
- Very nice practical heuristics; top down algorithms, e.g, ID3

ID3: Natural greedy approach to growing a decision tree top-down (from the root to the leaves by repeatedly replacing an existing leaf with an internal node.).

#### Algorithm:

- Pick "best" attribute to split at the root based on training data.
- Recurse on children that are impure (e.g, have both Yes and No).

[ID3, C4.5, Quinlan]

ID3: Natural greedy approaches where we grow the tree from the root to the leaves by repeatedly replacing an existing leaf with an internal node.

node = Root

Main loop:

- 1.  $A \leftarrow$  the "best" decision attribute for next *node*
- 2. Assign A as decision attribute for *node*
- 3. For each value of A, create new descendent of node
- 4. Sort training examples to leaf nodes
- 5. If training examples perfectly classified, Then STOP, Else iterate over new leaf nodes.

Key question: Which attribute is best?

[ID3, C4.5, Quinlan]

ID3: Natural greedy approach to growing a decision tree top-down.

#### Algorithm:

- Pick "best" attribute to split at the root based on training data.
- Recurse on children that are impure (e.., have both Yes and No).

Day	Outlook	Temperature	Humidity	Wind	Play
D1	Sunny	Hot	High	Weak	Tennis
D2	Sunny	Hot	High	Strong	No
D3	Overcast	$\operatorname{Hot}$	High	Weak	Yes
D4	Rain	Mild	High	Weak	Yes
D5	Rain	Cool	Normal	Weak	Yes
D6	Rain	Cool	Normal	Strong	No
D7	Overcast	Cool	Normal	Strong	Yes
D8	Sunny	Mild	$_{ m High}$	Weak	No
D9	Sunny	Cool	Normal	Weak	Yes
D10	Rain	Mild	Normal	Weak	Yes
D11	Sunny	Mild	Normal	Strong	Yes
D12	Overcast	Mild	High	Strong	Yes
D13	Overcast	Hot	Normal	Weak	Yes
D14	Rain	Mild	High	Strong	No

Key question: Which attribute is best?

ID3 uses a statistical measure called information gain (how well a given attribute separates the training examples according to the target classification)

Which attribute to select?

ID3: The attribute with highest information gain.

a statistical measure of how well a given attribute separates the training examples according to the target classification

Information Gain of A is the expected reduction in entropy of target variable Y for data sample S, due to sorting on variable A

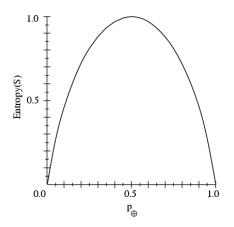

$$Gain(S, A) = H_S(Y) - H_S(Y|A)$$

Entropy information theoretic measure that characterizes the impurity of a labeled set S.

# Sample Entropy of a Labeled Dataset

- *S* is a sample of training examples
- $p_{\oplus}$  is the proportion of positive examples in *S*.
- $p_{\ominus}$  is the proportion of negative examples in *S*.
- Entropy measures the impurity of *S*.

$$H(S) \equiv -p_{\oplus} \log_2 p_{\oplus} - p_{\ominus} \log_2 p_{\ominus}$$

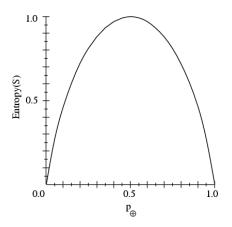

- E.g., if all negative, then entropy=0. If all positive, then entropy=0.
- If 50/50 positive and negative then entropy=1.
- If 14 examples with 9 positive and 5 negative, then entropy=.940

# Sample Entropy of a Labeled Dataset

- *S* is a sample of training examples
- $p_{\oplus}$  is the proportion of positive examples in *S*.
- $p_{\ominus}$  is the proportion of negative examples in S.
- Entropy measures the impurity of *S*.

$$H(S) \equiv -p_{\bigoplus} \log_2 p_{\bigoplus} - p_{\ominus} \log_2 p_{\ominus}$$

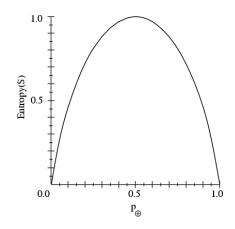

Interpretation from information theory: expected number of bits needed to encode label of a randomly drawn example in S.

- If S is all positive, receiver knows label will be positive, don't need any bits.
- If S is 50/50 then need 1 bit.
- If S is 80/20, then in a long sequence of messages, can code with less than 1 bit on average (assigning shorter codes to positive examples and longer codes to negative examples).

# Sample Entropy of a Labeled Dataset

- *S* is a sample of training examples
- $p_{\oplus}$  is the proportion of positive examples in *S*.
- $p_{\ominus}$  is the proportion of negative examples in S.
- Entropy measures the impurity of *S*.

$$H(S) \equiv -p_{\bigoplus} \log_2 p_{\bigoplus} - p_{\ominus} \log_2 p_{\ominus}$$

If labels not Boolean, then  $H(S) = \sum_{i \in Y} -p_i \log_2 p_i$ 

E.g., if c classes, all equally likely, then  $H(S) = \log_2 c$ 

#### **Information Gain**

Given the definition of entropy, can define a measure of effectiveness of attribute in classifying training data:

Information Gain of A is the expected reduction in entropy of target variable Y for data sample S, due to sorting on variable A

$$Gain(S, A) = Entropy(S) - \sum_{v \in values(A)} \frac{|S_v|}{|S|} Entropy(S_v)$$
entropy of original collection

Expected entropy after S is partitioned using attribute A

sum of entropies of subsets  $S_v$  weighted by the fraction of examples that belong to  $S_v$ .

#### **Information Gain**

Given the definition of entropy, can define a measure of effectiveness of attribute in classifying training data:

Information Gain of A is the expected reduction in entropy of target variable Y for data sample S, due to sorting on variable A

$$Gain(S,A) = Entropy(S) - \sum_{v \in values(A)} \frac{|S_v|}{|S|} Entropy(S_v)$$
entropy of original collection
$$Expected entropy after S is partitioned using attribute A$$

Gain(S,A) information provided about the target function, given the value of some other attribute A.

# **Selecting the Next Attribute**

Which attribute is the best classifier?

$$Gain(S, A) = Entropy(S) - \sum_{v \in values(A)} \frac{|S_v|}{|S|} Entropy(S_v)$$

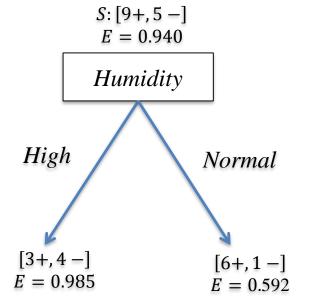

Day	Outlook	Temperature	Humidity	Wind	Play Tennis
D1	Sunny	Hot	$_{ m High}$	Weak	No
D2	Sunny	$\operatorname{Hot}$	$_{ m High}$	Strong	No
D3	Overcast	$\operatorname{Hot}$	High	Weak	Yes
D4	Rain	$\operatorname{Mild}$	High	Weak	Yes
D5	Rain	Cool	Normal	Weak	Yes
D6	Rain	Cool	Normal	Strong	No

D14	Rain	$\operatorname{Mild}$	$_{ m High}$	Strong	No

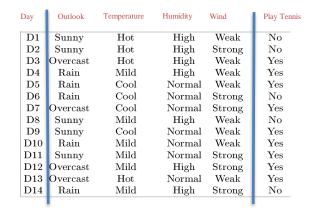

$$Entropy[9+,5-] = -\left(\frac{9}{14}\right)\log_2\left(\frac{9}{14}\right) - \left(\frac{5}{14}\right)\log_2\left(\frac{5}{14}\right) = .940$$

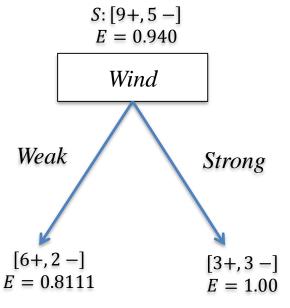

# **Selecting the Next Attribute**

#### Which attribute is the best classifier?

$$Gain(S, A) = Entropy(S) - \sum_{v \in values(A)} \frac{|S_v|}{|S|} Entropy(S_v)$$

Gain(S, Humidity)  
= .940 - 
$$\left(\frac{7}{14}\right)$$
. 985 -  $\left(\frac{7}{14}\right)$ . 592  
= .151

$$Gain(S, Wind)$$
= .940 -  $\left(\frac{8}{14}\right)$ .811 -  $\left(\frac{6}{14}\right)$ 1.0
= .048

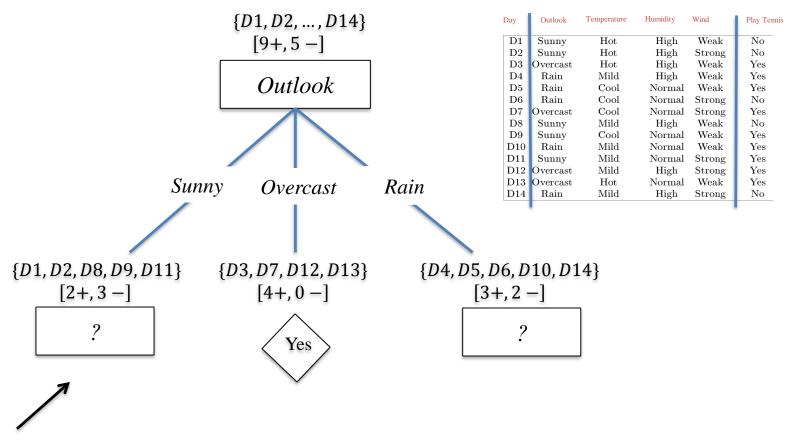

# **Selecting the Next Attribute**

Which attribute is the best classifier?

$$Gain(S, A) = Entropy(S) - \sum_{v \in values(A)} \frac{|S_v|}{|S|} Entropy(S_v)$$

Gain(S, Humidity) = .151 Gain(S, Wind) = .048 Gain(S, Outlook) = .246 Gain(S, Temperature) = .029

Day	Outlook	Temperature	Humidity	Wind	Play Tennis
D1	Sunny	Hot	High	Weak	No
D2	Sunny	$\operatorname{Hot}$	High	Strong	No
D3	Overcast	$\operatorname{Hot}$	$\operatorname{High}$	Weak	Yes
D4	Rain	$\operatorname{Mild}$	High	Weak	Yes
D5	Rain	Cool	Normal	Weak	Yes
D6	Rain	Cool	Normal	Strong	No
D7	Overcast	Cool	Normal	Strong	Yes

Yes

# **Properties of ID3**

- ID3 performs heuristic search through space of decision trees
- It stops at smallest acceptable tree. Why?

Occam's razor: prefer the simplest hypothesis that fits the data

# **Properties of ID3**

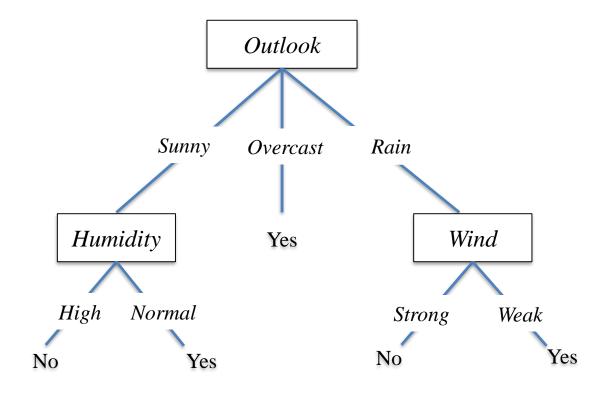

• ID3 performs heuristic search through space of decision trees

- It tends to have the right bias (output short decision trees), but it can still overfit.
- It might be beneficial to prune the tree by using a validation dataset.

### **Overfitting in Decision Trees**

Consider adding noisy training example #15: Sunny, Hot, Normal, Strong, PlayTennis = No What effect on earlier tree?

# **Properties of ID3**

Overfitting could occur because of noisy data and because ID3 is not guaranteed to output a small hypothesis even if one exists.

Consider a hypothesis *h* and its

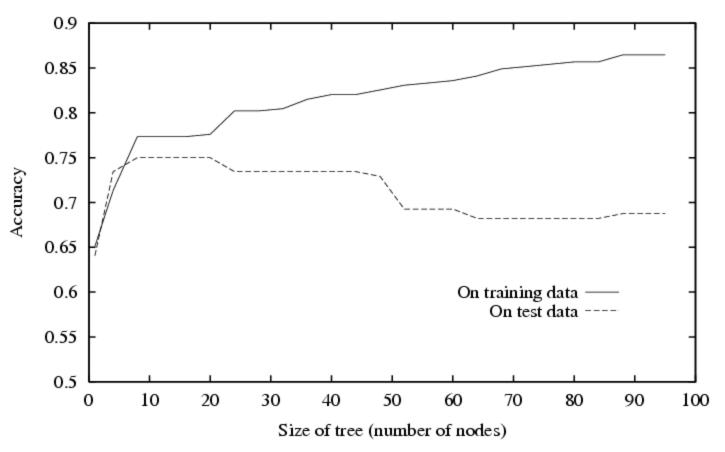

- Error rate over training data:  $error_{train}(h)$
- True error rate over all data:  $error_{true}(h)$

We say *h* overfits the training data if

$$error_{true}(h) > error_{train}(h)$$

Amount of overfitting =  $error_{true}(h) - error_{train}(h)$ 

## Overfitting in Decision Tree Learning

Task: learning which medical patients have a form of diabetes.

# **Avoiding Overfitting**

How can we avoid overfitting?

- Stop growing when data split not statistically significant
- Grow full tree, then post-prune

# Key Issues in Machine Learning

- How can we gauge the accuracy of a hypothesis on unseen data?
  - Occam's razor: use the *simplest* hypothesis consistent with data!
     This will help us avoid overfitting.
  - Learning theory will help us quantify our ability to generalize as a function of the amount of training data and the hypothesis space
- How do we find the best hypothesis?
  - This is an **algorithmic** question, the main topic of computer science
- How do we choose a hypothesis space?
  - Often we use **prior knowledge** to guide this choice
- How to model applications as machine learning problems? (engineering challenge)
